TRAVELGO

Travel Website Project – Explanation

A simple explanation of the website pages, layout, design elements and technologies.

1. Introduction

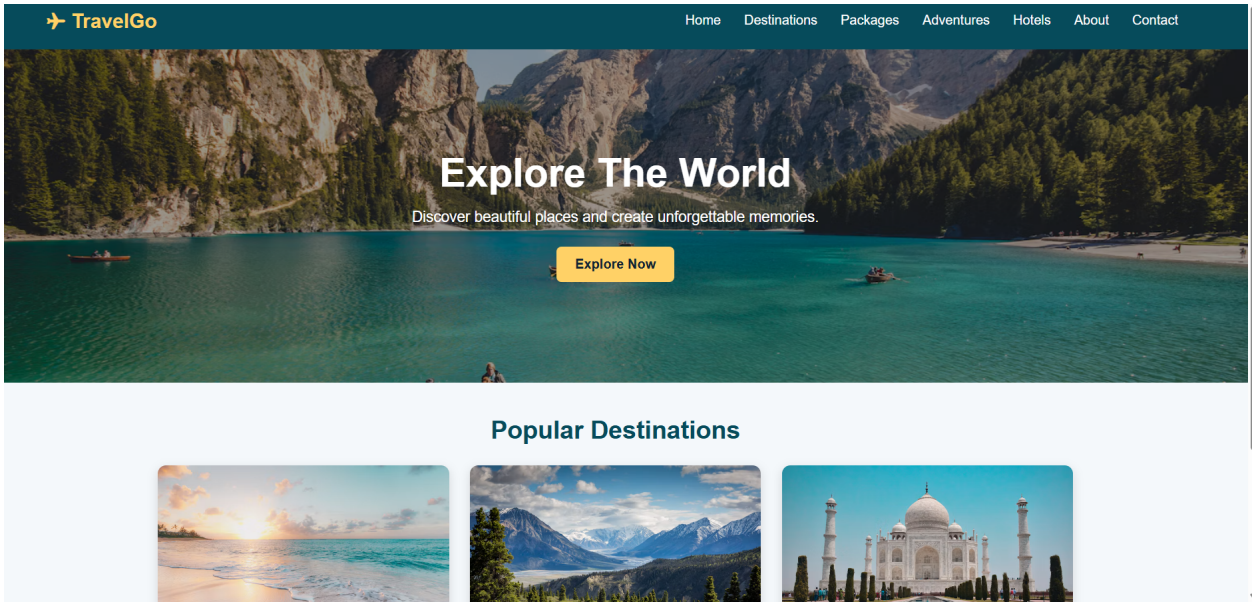

TravelGo is a travel website concept designed to help visitors explore destinations and get ideas for holidays. The website brings travel information together in one place, including places to visit, tour packages, adventure activities and accommodation options. Its main purpose is to make travel information easy to view and understand.

2. Common Website Design

- **Header and navigation bar:** A dark teal bar appears at the top. It contains the TravelGo name with a small airplane symbol and links such as Home, Destinations, Packages, Adventures, Hotels, About and Contact.
- **Colour theme:** Dark teal and turquoise are used for the header and section headings. Yellow is used to highlight the TravelGo logo and important buttons. A light background keeps the content easy to read.
- **Cards:** Several pages use cards containing an image, a heading and a short description. Rounded corners and shadows help separate each card from the page background.
- **Footer:** The pages show a dark teal footer with the copyright text “© 2026 TravelGo”.
- **Consistency:** Reusing the same header, colours, card style and footer gives the pages a consistent appearance.

3. Home Page

The Home page is the first page visitors see. It has a large background photograph of a scenic lake surrounded by mountains and trees. Text in the centre says “Explore The World”, followed by a short travel message. The yellow “Explore Now” button is used as a call to action. Below the banner, a Popular Destinations section introduces places visitors may want to explore. The large image and central text make the page attractive and welcoming.

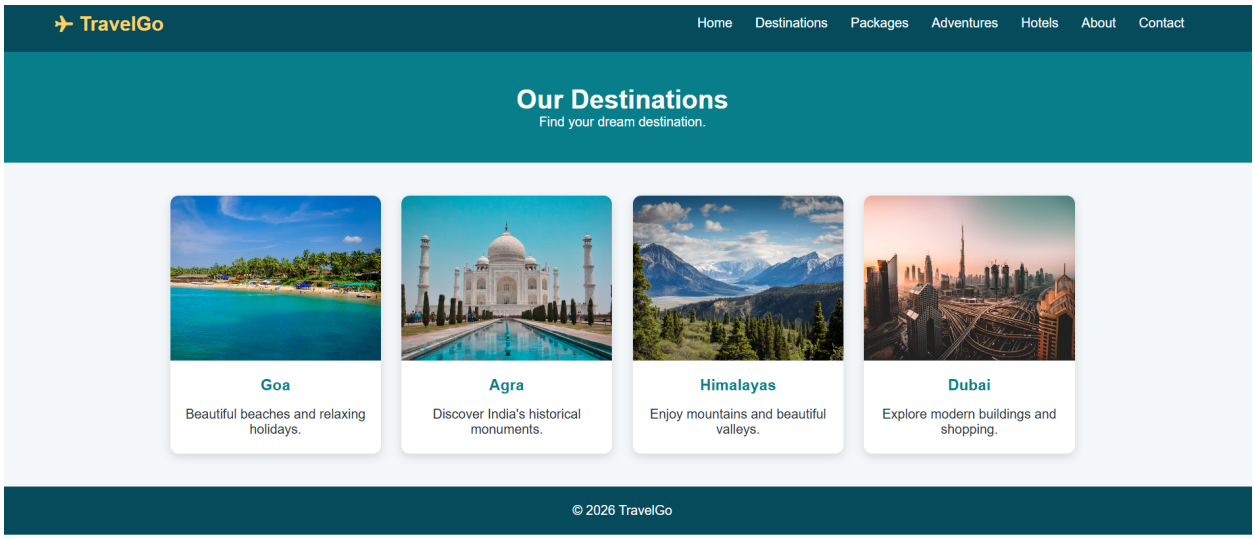

Home page – hero banner and popular destinations

4. Destinations Page

The Destinations page introduces places to visit. A turquoise title banner displays “Our Destinations” and a short subtitle. Below it, four destination cards are shown: Goa, Agra, Himalayas and Dubai. Each card contains a photograph, destination name and a brief description. For example, Goa is described as a beach holiday destination, while Agra is presented through its historical monuments. This card layout allows

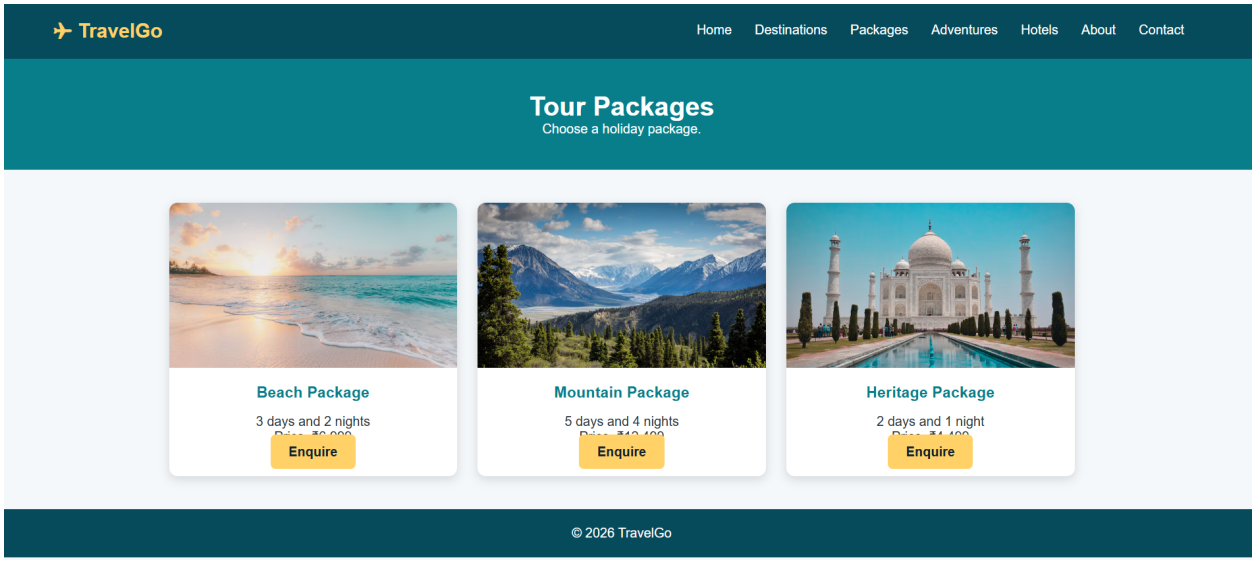

visitors to compare destinations quickly.

Destinations page – four destination cards

5. Tour Packages Page

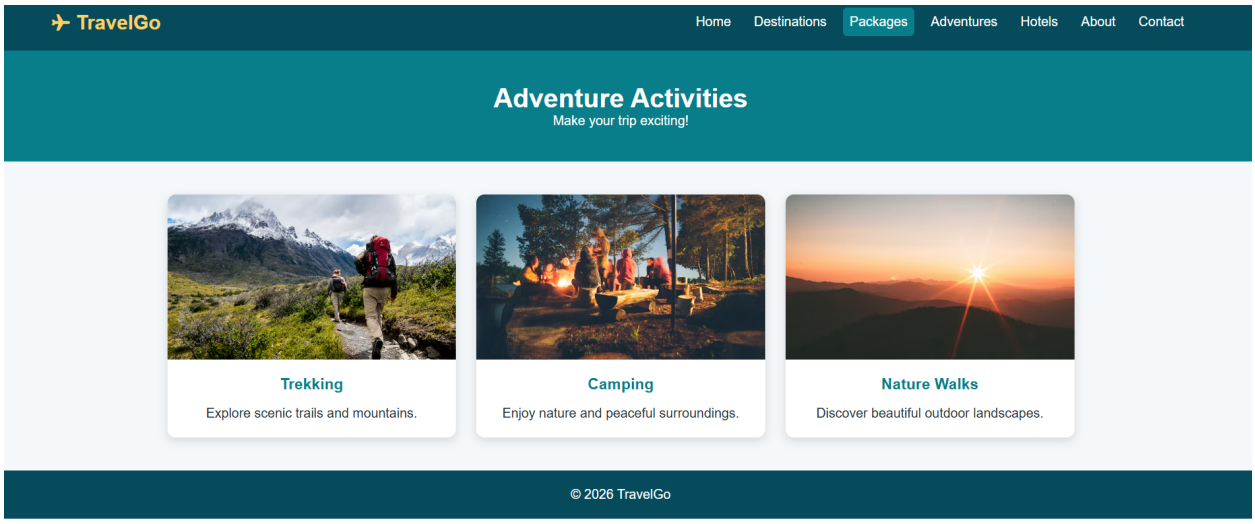

The Tour Packages page presents sample holiday packages. Its heading area says “Tour Packages” with the subtitle “Choose a holiday package.” Three cards show a Beach Package, Mountain Package and Heritage Package. Each card includes a related image, trip duration and an “Enquire” button. The buttons are intended to let visitors express interest in a package or move to an enquiry section when that functionality is connected.

Packages page – sample holiday options

6. Adventure Activities Page

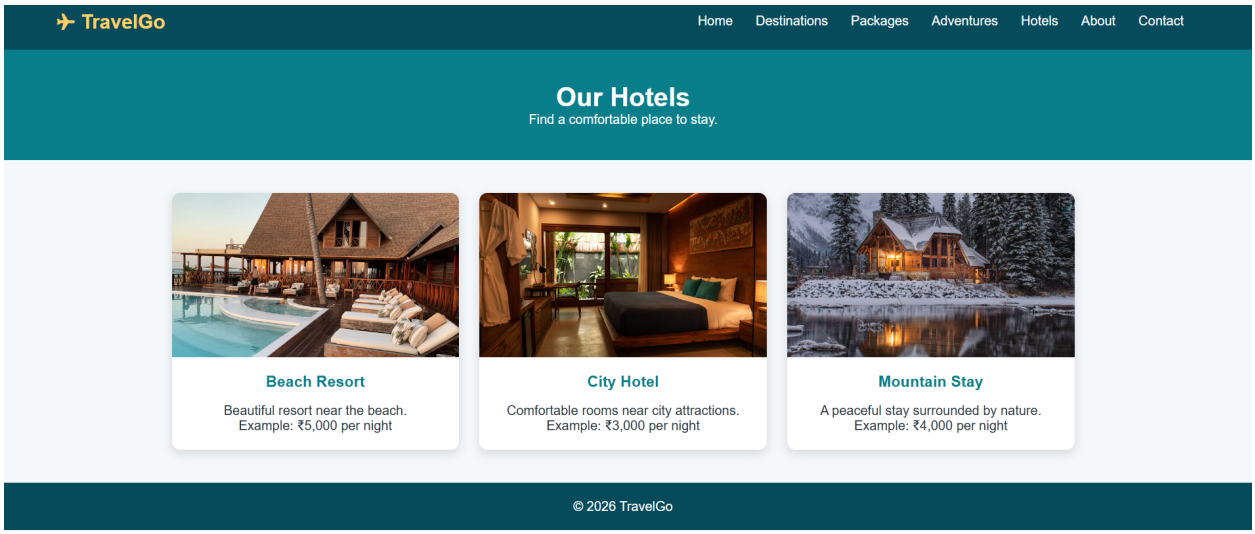

The Adventure Activities page highlights outdoor experiences. It contains three cards: Trekking, Camping and Nature Walks. Each card uses a relevant photograph and a short sentence describing the activity. The page helps visitors discover activities they might include in a trip.

Adventure page – trekking, camping and nature walks

7. Hotels Page

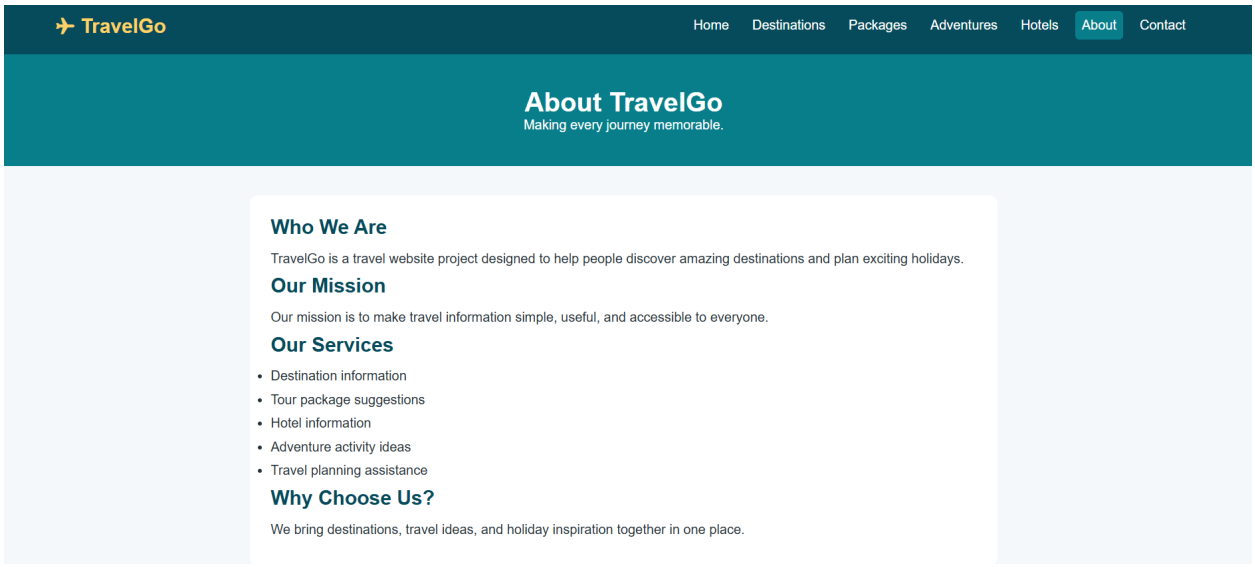

The Hotels page gives visitors examples of places to stay. It displays three cards: Beach Resort, City Hotel and Mountain Stay. Each card includes a hotel-related photograph and a short description. Example nightly prices are also displayed: ■5,000, ■3,000 and ■4,000 respectively. These are sample prices shown in the project design, not verified live hotel rates.

Hotels page – accommodation examples

8. About Page

The About page explains the purpose of TravelGo. It includes sections titled “Who We Are”, “Our Mission”, “Our Services” and “Why Choose Us?”. The text describes TravelGo as a travel website project that helps people discover destinations and plan holidays. The services list includes destination information, tour package suggestions, hotel information, adventure activity ideas and travel planning assistance.

About page – purpose, mission and services

9. Technologies Used

HTML (HyperText Markup Language): HTML is used to create the structure of the website. Elements such as headings, paragraphs, navigation links, images, sections, cards and buttons organise the content.

CSS (Cascading Style Sheets): CSS is used to style the website. It controls colours, fonts, spacing, alignment, background images, card layouts, borders, rounded corners, shadows and responsive behaviour.

Images: Photographs make the pages visually interesting and help visitors understand the destinations, activities and accommodation being presented.

10. Navigation and User Experience

The navigation bar is repeated across the pages so visitors can move between the main sections. The consistent colour scheme and card layouts make the website easier to follow. The design is organised so that visitors can browse destinations, compare sample packages, view activities and read hotel information.

11. Conclusion

TravelGo is a multi-page travel website project that presents travel-related information in a simple and attractive format. It demonstrates how HTML can organise content into separate pages and how CSS can improve the appearance of a website. The project includes a home page, destinations, packages, adventures, hotels and about page. Overall, it provides a clear example of a travel website layout using images, navigation links, text and content cards.

Note: The screenshots show the visual design. Features such as live bookings, working enquiries, search and payment would need additional code or backend services if they are required.
